Bladder Management: Using a Condom Catheter

A condom catheter may be used for men who have lost some or all control over their bladder. The condom catheter attaches to a urine drainage to keep the man from having bladder accidents. It can be used short term and long term to manage the bladder.

How to apply:
- Wash the skin with soap and water.
- Apply skin prep and allow to dry.
- Apply condom. Make sure the correct size is used. Too tight will reduce blood flow. Too loose will cause it to leak.
- Attach urine drainage bag
- Change condom at least every 24 hours to monitor for skin breakdown.

- Remove condom for bathing.
- For males who are not circumcised make sure that foreskin is not pulled back when the condom is put on.
- After taking off condom, signs of skin breakdown are:
  - Redness
  - Open areas
  - Skin tears
  - If any of these happen, leave condom off and call your doctor to talk about other options.

Condom catheters allow people with bladder leakage to go through daily activities without the worry of accidents.
